## Calculating Decadal Growth Rate

Courtesy of D. Bruce Seymour, March 2004

## Equation \#1: Simplified Decadal Growth Rate

If you have data that is ten years apart use this equation to obtain the growth rate for the decade, Decadal Growth Rate (DGR):

```
\(D G R=\left(\frac{P_{n}-P_{o}}{P_{o}}\right) * 100\)
DGR = Decadal Growth Rate in \%
\(\mathrm{P}_{\mathrm{n}} \quad=\) Population now
\(\mathrm{P}_{\mathrm{o}} \quad=\) Population originally
\(P_{n}\) and \(P_{o}\) are ten years apart
```

## Equation \#2: General Decadal Growth Rate

If you have data that is not ten years apart, this equation can be used to obtain an adjusted growth rate so it can be compared with other decadal growth rates $\left(\mathrm{DGR}_{\mathrm{a}}\right)$.
$D G R_{a}=\left\lfloor\left(\frac{P_{n}}{P_{o}}\right)^{\frac{10}{N}}-1\right\rfloor * 100$
$\mathrm{DGR}_{\mathrm{a}}=$ Decadal Growth Rate (Adjusted for comparison) in \%
$\mathrm{P}_{\mathrm{n}} \quad=$ Population now
$\mathrm{P}_{\mathrm{o}} \quad=$ Population originally
$\mathrm{N} \quad=$ Interval between $\mathrm{P}_{\mathrm{n}}$ and $\mathrm{P}_{\mathrm{o}}$ in years

## Projected Growth

If you wish to calculate projected growth to some point in the future, first calculate the Annual Growth Rate (R) with Equation \#3 and then calculate the Projected Growth $\left(\mathrm{P}_{\mathrm{f}}\right)$ with Equation \#4.

## Equation \#3: Annual Growth Rate

$R=\left\lfloor\left(\frac{P_{n}}{P_{o}}\right)^{\frac{1}{N}}-1\right\rfloor * 100$
$\mathrm{R} \quad=$ Annual Growth Rate (in \%)
$\mathrm{P}_{\mathrm{n}} \quad=$ Population now
$\mathrm{P}_{\mathrm{o}} \quad=$ Population originally
$\mathrm{N} \quad=$ Interval between $\mathrm{P}_{\mathrm{n}}$ and $\mathrm{P}_{\mathrm{o}}$ in years
Equation \#4: Projected Growth

$$
P_{f}=P_{n}(1+r)^{N}
$$

$\mathrm{P}_{\mathrm{f}} \quad=$ Population in the future
$\mathrm{P}_{\mathrm{n}} \quad=$ Population now
$r \quad=$ Annual growth rate (as a decimal)
$\mathrm{N} \quad=$ Interval between $\mathrm{P}_{\mathrm{n}}$ and $\mathrm{P}_{\mathrm{f}}$ in years

Example \#1: Suppose your average attendance in 2003 is 400 and your average attendance in 1993 was 175. What is your decadal growth rate?

The data is ten years apart $(2003-1993=10)$ so use Formula \#1
$\mathrm{P}_{\mathrm{n}} \quad=$ Population now $=400$
$\mathrm{P}_{\mathrm{o}} \quad=$ Population originally $=175$
$D G R=\left(\frac{P_{n}-P_{o}}{P_{o}}\right) * 100$
$\mathrm{DGR}=\left(\frac{400-175}{175}\right) * 100$
$\mathrm{DGR}=\left(\frac{225}{175}\right) * 100$
$\mathrm{DGR}=(1.2857) * 100$
$\mathrm{DGR}=128.57 \%$ (DGR is usually reported in whole numbers so round up to the nearest whole number)
DGR $=129 \%$

Example \#2: Suppose your average attendance in 2003 is 850 and your average attendance in 1998 was 500. What is your decadal growth rate?

Data is not ten years apart so use Formula \#2
$\mathrm{P}_{\mathrm{n}} \quad=$ Population now $=850$
$\mathrm{P}_{\mathrm{o}} \quad=$ Population originally $=500$
$\mathrm{N}=2003-1998=5$
$D G R_{a}=\left\lfloor\left(\frac{P_{n}}{P_{o}}\right)^{\frac{10}{N}}-1\right\rfloor * 100$
$\mathrm{DGR}_{\mathrm{a}}=\left[\left(\frac{850}{500}\right)^{\frac{10}{5}}-1\right] * 100$
$\mathrm{DGR}_{\mathrm{a}}=\left[(1.7)^{2}-1\right] * 100$
$\mathrm{DGR}_{\mathrm{a}}=[(2.89)-1] * 100$
$\mathrm{DGR}_{\mathrm{a}}=[1.89] * 100$
$\mathrm{DGR}_{\mathrm{a}}=189 \%$

Example \#3: Suppose your average attendance in 1998 was 500 and your average attendance in 2003 is 850 . If you continue to grow at the same rate, what would your average attendance be in 2010 ?

Begin by calculating the annual growth rate using Equation \#3.
$R=\left\lfloor\left(\frac{P_{n}}{P_{o}}\right)^{\frac{1}{N}}-1\right\rfloor * 100$
$\mathrm{R} \quad=$ Annual Growth Rate (in percent)
$\mathrm{P}_{\mathrm{n}} \quad=$ Population now $=850$
$\mathrm{P}_{\mathrm{o}} \quad=$ Population originally $=500$
$\mathrm{N} \quad=$ Interval between $\mathrm{P}_{\mathrm{n}}$ and $\mathrm{P}_{\mathrm{o}}$ in years $=5$
$R=\left[\left(\frac{850}{500}\right)^{\frac{1}{5}}-1\right] * 100$
$R=\left[(1.7)^{0.2}-1\right] * 100$
$R=[0.112] * 100$
$R=11.2 \%$

Continue by using the decimal form of this rate (0.112) and calculate projected growth with Equation \#4.

$$
P_{f}=P_{n}(1+r)^{N}
$$

$\mathrm{P}_{\mathrm{f}} \quad=$ Population in the future
$\mathrm{P}_{\mathrm{n}} \quad=$ Population now $=850$
$\mathrm{N} \quad=$ Interval between $\mathrm{P}_{\mathrm{n}}$ and $\mathrm{P}_{\mathrm{f}}$ in years $=7$
$r \quad=$ annual growth rate in decimal form $=0.112$

$$
\begin{aligned}
& P_{f}=850 *(1+0.112)^{7} \\
& P_{f}=850 *(1.112)^{7} \\
& P_{f}=850 *(2.103) \\
& P_{f}=1785
\end{aligned}
$$
